                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense inhibitor; oligonucleotide delivery agent; erythema multiforme; expression modulator; cellular adhesion protein; malignant melanoma; cellular proliferation modification; toxic epidermal necrolysis; psoriasis; lichen planus; carcinoma; Paget's disease; Kaposi's sarcoma; pulmonary fibrosis; Lyme disease; infection; therapy; ICAM-1; ss.
                                                                                                                                                                The invention relates to ebl-1 polypeptides that are encoded by the DBL (Duffy-binding like) gene family. The ebl-1 proteins are substantially identical to the Duffy-binding like) gene family. The ebl-1 proteins are substantially binding Protein (BABP) and Sialic Acid Binding Protein (BABP), which are soluble proteins that appear in the culture supernatant after erythrocytes infected with malaria release merozoites. Immunochemical studies indicate that DABP and SABP are the respective ligands for Plasmodium viox and Plasmodium falciparum Duffy and sialic acid receptors on erythrocytes. The ebl-1 polypeptides may be used to vaccinate against malaria, especially caused by P. falciparum. Immunization with the polypeptide provides effective protection against malaria. Sequences AAZ982397-304 represent primers used for isolating sequences encoding the conserved motifs of the DBL family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents an antisense inhibitor of ICAM-1. The invention relates to a pharmaceutical composition comprises an oligonucleotide (ON)
                                                    Isolated protein binding domains from Plasmodium vivax and Plasmodium falciparum erythrocyte binding proteins useful for vaccinating against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the

admixed with a topical delivery agent. The compositions can be used for the delivery of a ribozyme, an external guide sequence, an antisense ON an antisense peptide nucleic acid, an aptamer or a molecular decoy. The ONS can be used to modulate expression of a cellular adhesion protein or modulate a rate of cellular proliferation. The compositions can also be used to treat psoriasis. They can also be used to treat e.g. lichen planus, toxic epidermal necrolysis, erythema multiforme, basal cell carcinoma, squamous cell carcinoma, malignant melanoma, Paget's disease, Kaposi's sarcoma, pulmonary fibrosis, Lyme disease and viral, fungal and bacterial infections of the skin. They can be used to treat humans and primates, avians including chickens and turkeys, domestic household, sport of farm annials including rate, mice, rabbits and quinea pigs, fish, reptiles and zoo animals. The compositions and methods may also be used to examine the function of various proteins and genes in vitro in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mutation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a vector (I) comprising an isolated DNA sequence of a multiple tumour suppressor (MTS) gene having a

```
polynucleotide sequence of the human MTSIE1-beta. (I) is useful for introducing wild-type MTS function to a cancerous or pre-cancerous cell which carries diminished or mutant MTS alleles for suppressing neoplastic growth of the recipient cells. (I) is also useful for increasing the recipient cells. (I) is also useful for increasing the level of expression of MTS gene even in tumour cells in which the mutant gene is expressed at a normal level but the gene product is not fully functional. A host cell transformed with (I) is useful as a model system to study cancer remission and drug treatment which promotes such cemission. The present invention relates to somatic mutations and germ line mutations in the MTS gene and their use in the diagnosis and prognosis of human cancer e.g. melanoma, leukaemia, astrocycoma, glioplastoma, lymphoma, glioma, Hodgkin's lymphoma, and cancers of the panceant invention ceptesents a PCR primer used in an example from the present invention

Antisense oligonucleotides for treating hepatitis and colon, liver or lung cancer are inhibitors of Fas, Fas ligand or Fas associated protein 1 (Fap-1) expression.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the numan genome, and in complex association studies and haphotyphing studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the agents and side effects from

Novel biallelic markers used to construct a high density disequilibrium

                                                          AAC61821-39 represent antisense oligonucleotides which are directed against mucleid acids encoding human Fas ilgand. The specification describes antisense compounds which are targeted to the 5'-uutranslated region, translational start site, translational termination region or 3'-uutranslated region of nucleic acid molecules encoding Fas, Fas, Fagr-1 (Fas associated protein 1, protein tyrosine phosphatase). The antisense compounds are used to inhibit the expression of Fas, Fas, or Fapr-1 in cells or tissues. They are used to trast autoimmune or inflammatory diseases such as hepatitis. They can also be used to treat cancer, especially colon, liver or lung cancer or lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human biallelic marker downstream amplification primer SEQ ID NO:11617.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

Human, SHP-1; Src homology region 2-domain phosphatase; phosphorothioate, cytosolic tyrosine phosphatase; antisense oligonucleotide; cancer; leukaemia; inflammation; infection; ss.
                                                                                                                                                                                                                                                                                                                 Novel antisense oligonucleotides for modulating the expression of human SHP-1, especially for treating a disease or condition associated with SHP-1 expression, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense oligonucleotides which modulate the expression of human SHP-1 (Src homology region 2-domain phosphatase) a cytosolic tyrosine phosphatase. The invention includes antisense molecules AAA09644-A09683 which have modified phosphorothioate internucleoside linkages which target various regions of the SHP-1 gene. The oligonucleotides inhibit the expression of human SHP-1 in cells or tissues, and may be used to treat diseases or conditions associated with SHP-1 expression e.g. cancers, specifically leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AGP-3; tumour necrosis factor ligand; TNF ligand; Crohn's disease; type II transmembrane protein; B cell stimulatory factor; inflammatory disorder; immune disorder; rheumatoid arthritis; lupus and graft versus host disease; PCR primer; ss.

PCR primers AAA61936-37 were used to amplify cDNA encoding a murine AGP-3 polypeptide. AGP-3 is a tumour necrosis factor (TNF) ligand family member. AGP-3 is a type II transmembrane protein, and is a potent B cell stimulatory factor. Expression of AGP-3 correlates to increases in the number of B cells and immunoglobulins produced. AGP-3 proteins, antibodies, and nucleic acids may be used to treat inflammatory and immuno disorders, e.g. rheumatorid arthritis, Crohn's disease, lupus and graft versus host disease. The nucleic acids may be used to regulate the expression of an AGP-3 related protein. The AGP-3 proteins, antibodies and nucleic ands are also useful for the detection of AGP-3 agonists, antagonists and characterizing interactions with AGP-3 related proteins
                                                                            Novel polypeptides comprising tumor necrosis factor ligand family protein; useful for treating inflammatory and immune disorders, e.g. rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cook PD, Tillman L, Hardee GE, Ecker DJ, Manoharan M;

This invention describes a novel method for determining the identity of a specific nucleotide at one or more defined sites in a target nucleic acid polymer involves formation of a detectable primer extension product if the specific nucleotide is present at the defined site in the target nucleic acid. The method is specifically used to detect point mutations which are associated with altered pathogenicity or resistance to therapy
                                                                                                Sequences AAZ49336-Z49343 and AAZ49390 represent antisense oligonucleotides designed to modulate cellular adhesion. The invention relates to new compositions for the non-parenteral delivery of oligonucleotides comprising at least one oligonucleotide in an emulsion. Oligonucleotides delivered via the compositions of the invention can be used to modulate expression of a cellular adhesion protein, modulate a rate of cellular proliferation, or have biological activity against evikaryotic pathogens or retrovituses. They can be used for treating conditions including e.g., ulcerative colitis, Crohn's disease, inflammatory bowel disease or undue cellular proliferation. The compositions can enhance the local and systemic uptake and delivery of nucleic acids via non-parenteral routes of administration (e.g., via the alimentary canal, skin, eyes, pulmonary tract, urethra or vagina)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying the nucleotide at specific position in a target sequence for detecting disease-related point mutations involves extending a primer that binds adjacent to the specific site to incorporate a labeled deoxynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection, primer extension, point mutation, pathogenicity, therapy; cancer, genetic disease, K-ras, human, PCR primer, mutation, ss.

in a microorganism, particularly human immune deficiency virus or with cancer or a genetic disease (or susceptibility to it) in humans, but more generally can be used to detect mutations in RNA or DNA from animals, plants or microorganisms. By selecting a primer that binds adjacent to the specific site, variations at this site can be detected following incorporation of only a single dNTP. The method requires only a few, simple manipulations, making is suitable for routine use, and allows quantification of the proportion of mutated calls in a mixed population, down to 0.5% of this population. The method is easily automated. This sequence represents a PCR primer used to detect a mutation in the human K -ras gene

Reverse transcription of mRNA species used for expression profiling of single cells by employing a first heeled primer to provide first strand cDNA species and then a second heeled primer population to generate second strand cDNAs.

Example 1; Page 29; SOpp; English.

This invention describes a novel process (M1) of reverse transcribing mRNA species present in a sample from an organism by: (a) reverse transcribing the mRNA species using a first heeled primer, to provide a first strand CDNA species using a second heeled primers being second CDNA species using a second heeled primers being such that the reverse heel portions of the second heeled primers being such that the reverse transcribed first strand CDNA species are capable of hybridizing to at least one second primer. The processes can be used for expression profiling of single cells. The polynucleotide comprising an oligo d(T) sequence and a heel sequence 5, can be used for the reverse transcription of mRNA species in a sample. The polynucleotide primer population of clam (4) can be used for the synthesis of second strand CDNA from a population of first strand CDNA species. Single cell CDNA libraries can be made for subsequent detailed analysis of gene expression and the AAZB92111/ AAZB92111/ AAZBAAC AAZB XXX AAC AAZB XXX Huma XXX Huma XXX HODE XXX HODE XXX WO20 XXX

discovery of novel genes. Small samples can be used and allow the utilization of the large amount of sequence data available for further understanding of disease processes and repertance of complex issues. The invention provides a rapid, robust and reproducible procedure (aslee Three Prime End Amplification (TPEA). Optionally with PCR (TPEA-CR). Prior art methods for the analysis of gene expression within single cells or small tissue samples are limiting. Whilst in situ hybridization techniques provide detailed information about the cellular expression pattern of a gene in intact tissue the technique is laborious and unable to analyze multiple transcripts in a single preparation. The methods presented in the disclosure provide a more straightforward, reproducible and reliable cDNA amplification procedure for small mRNA samples where expression profiling can be conducted. The amplification technique can be expression profiling can be conducted. The amplification technique can be carried out in a single tube with a need for only limited manual arge numbers of samples can be analyzed. There is a intervention and large numbers of samples can be analyzed. There we bias towards more uniform length cDNA molecules ensuring that even the calatively low abundance mRNA species are transcribed and optionally amplified at the same level of efficiency as more abundant mRNA species. Alzapalol 289253 represent the primers described in the method of the invention

New mutants of the human multiple tumor suppressor gene, useful as diagnostic markers of cancer, contain specific base alterations or deletions.

Example 12; Col 50; 72pp; English.

The invention relates to variants (AAA11196-A11206) of the human multiple potential anticancer agents. This sequence screen for the mouse MTS1 Elbeta sequence 3ennett CF, Mirabelli CK, Baker BF; Example 10; Page 176; 199pp; English. 505 GAGGGCTACCTGGAGAAGCT 524 20 GAAGGCTTCCTGGACACGCT 1 AAZ48909 standard; DNA; 20 BP 98US-00085759 99WO-US011548 29-MAR-2000 (first entry) Local Similarity 80.0 ies 16; Conservative (ISIS-) ISIS PHARM INC. ```
tumour suppressor 1 (MTS1) gene (AAA11165). The variants have the following changes relative to this sequence: A at any of positions 265, 442, 330 and 329; T at any of positions 172, 238, 341 and 148 and deletions of mucleoxides 290-294, 172-179 or 128-129. The variants are somatic mutations of MST1, indicative of predisposition to melanowa and many other cancers, so detecting them is useful for diagnosis, prognosis and monitoring of cancer (including prenatal analysis). Cells and animals that express the variants are useful as model systems for identifying potential anticancer agents. This sequence represents a primer used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Human ICAM-1 antisense inhibitor, ISIS #1939.
```

Antisense inhibitor; human; ICAM-1; intercellular adhesion molecule-1; vascular cell adhesion molecule-1; hyperproliferative disorder; VCAM-1; emodothelial leukocyte adhesion molecule-1; ELM-1; skin condition; cancer; viral infection; tumour; diappedesis; graft versus host disease; arthritis; infection; autoimmune disorder; multiple sclerosis; stroke; purchile diabetees mellitus; arthritis; myasthenia gravis; therapy; pemphigus vulgaris; systemic lupus erythematosus; autoe myocarditis; cardiovascular disorder; dilated cardiomyopathy; ischaemic heart disease;

New antisense oligonucleotides, used for treating e.g. inflammatory conditions, psoriasis, graft rejection, cancers, infections, cardiovascular disorders or autoimmune disorders.

This sequence is an antisense oligonuclectide of the invention. The antisense oligonuclectides are targeted to a nucleic acid encoding a cellular adhesion molecule (CAM) and is capable of modulating the expression of the CAM. They particularly inhibit intercellular adhesion molecule-1 (ICAM-1), vascular cell adhesion molecule-1 (UCAM-1), or endotherial leukocyte adhesion molecule (ILAM-1). The antisense oligonuclectides can be used to modulate CAM activity in mediating cell:cell interactions and subsequent cellular and biological responses,

```
antisense sequences can be used for modulating the synthesis of a CAM.

They can be used for modulating the synthesis of a CAM.

They can be used for treating an animal suspected of having or being proceed to a disease or condition associated with a CAM. Oligonucleotides targeted to ICAM-1 can be used for treating an inflammatory disease or condition e.g. inflammatory bowel disease such as Crohr's disease or condition e.g. inflammatory bowel disease such as Crohr's disease or condition e.g. inflammatory bowel disease such as Crohr's disease or condition e.g. inflammatory bowel disease such as CAM-1 sequences or intermatitis, rhemmatoid arthritis, allograft rejection, cancer, or conting cor reducing corticosteroid use in a patient or for reducing cyclosporine use in a patient. The oligonucleotides can also be used for reducing corticosteroid use in a patient or for reducing cyclosporine use in a patient. The oligonucleotides can also be used for detection and diagnosis. They can also be used for treating e.g. hyperpolifestative disorders, tumours, diapedesis, graft versus host disease, arthritis, infections, autoimmune disorders, e.g. autoimmune to some of juvenile disorders mellitus, mysathenia gravis, pemphigus culgaris, systemic lupus erythematosus, cardiovascular disorders, myocardial ischaemia/reperfusion injury, dilated cardiomyopathy, acute myocarditis, ischaemic heart disease or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Typing polymorphic genes, useful to assess the association of alleles with diseases and in disease diagnosis, uses a taxonomy based sequence analysis in which a typing tree based on distinguishing sequences is constructed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a novel method for typing genes, particularly human leukocyte antigen (HLA) coding sequences. The methouses DNA sequences and a taxonomy-based sequence analysis method to assign alleles for HLA-DQA1, HLA-DQB1 and HLA-DRB. These alleles have been linked to diseases such as diabetes, IgA deficiency, multiple sclerosis, cancer, clinical and immunological manifestations of HIV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides a novel method for typing genes, particularly human leukocyte antigen (HLA) coding sequences. The method uses DNA sequences and a taxonomy-based sequence analysis method to assign alleles for HLA-DQA! HLA-DQBI and HLA-DRB. These alleles have been linked to diseases such as diabetes, IgA deficiency, multiple sclerosis, cancer, clinical and immunological manifestations of HIV infection, coeliac disease, idiopathic nephrotic syndrome, immune responses to parasite antigens, pemphigus vulgaris, inflammatory bowel disease, rheumatoid arthritis, allergy and other inflammatory diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Typing polymorphic genes, useful to assess the association of alleles with diseases and in disease diagnosis, uses a taxonomy based sequence analysis in which a typing tree based on distinguishing sequences is
           responses to parasite antigens, pemphigus vulgaris, inflammatory bowel disease, rheumatoid arthritis, allergy and other inflammatory diseases
                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to an aggregated composition comprising a polypeptide having the transport function of herpesviral transport protein VP22. The aggregates can be useful for delivery of oligonucleotides and proteins into cells. The present sequence is one such oligonucleotide which may be delivered into cells using the method of the present invention. The aggregated composition is useful for preparing medicament for therapy or prophylaxis of a disease and for delivering molecules to cells in vitro. The aggregates are delivered to target cells such as tumour cells in vitvo and are useful for treating pooriasis, eczema or skin cancer

Human c-raf kinase antisense oligonucleotide #11 (Isis #5149).

94US-00250856. 95WO-US007111. 96US-00756806.

98US-00143214.

```
c-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation control. The present sequence is an antisense oligomuclectide. This sequence is targeted to human c-raf gene, resulting in c-raf expression inhibition. The present sequence may be useful for treating and rafsociated cell hyperproliferation conditions such as cancer, hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, and smooth muscle cell proliferation in blood vessels etheroselerosis and smooth muscle cell proliferation in blood vessels e.g. stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Interleukin 1 receptor antagonist short tandem repeat primer SEQ ID NO:7.

The present invention describes a method for predicting susceptibility to HIV infection or HIV progression in a subject. The method involves detecting a polymorphism in a human interleukin-10 (Li-10) promorer, where the presence of the polymorphism interleukin-10 (Li-10) promorer, infection or HIV progression. The method provides prognostic information to presence infected with HIV virus and is useful to help select treatments (such as administration of II-10 or gene therapy with II-10). The presence of polymorphism is useful as predictor that very aggressive treatment could substantially eradicate the virus from the infected person. The method is useful for the generation of normograms or other predictive algorithms that can be used, in association with allele status, to prognose probable survival or years to development of AIDS following HIV seroconversion. It indicates that increased expression of the II-10 gene helps to reduce HIV-1 infection and pathogenic progression and bushoes a variety of new therapeutic interventions in the treatment of HIV and all and and and pathogenic progression and bushoes a variety of new therapeutic interventions in the treatment of HIV and and and pathogenic progression when the predictive and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cell cycle regulation; corn; transgenic plant; cyclin; maize; soybean; cyclin-dependent Kinase; sunflower; sorghum; canola; wheat; alfalfa; cotton; rice; barley; millet; 88.
                                                                                                                                                                                                                                                                                                                                Predicting susceptibility to HIV infection or progression useful for selection of therapeutic treatment for persons infected with HIV virus, comprises detecting polymorphism in human interleukin-10 promoter,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of HIV disease. The present sequence represents a short tandem repeat (STR) primer which is used in an example from the present invention

Polymucleotide sequences AAC83101 - AAC83113 encode proteins AAB35794 -
AAB35806 which are involved in regulating the cell cycle. The protein and
DNA sequences have been isolated from Zea mays (corn), and the invention
also includes oligomucleotides. The cell cycle polymucleotide sequences
are useful for producing transgenic plants such as maize, soybean,
cunflower, sorghum, canola, wheat, alfalfa, cotton, rice, barley and
milet with increased levels of cell cycle gene activity, such as
activity of cyclin and cyclin-dependent kinases. The DNA sequences are
also useful as probes for detecting deficiencies in the level of mRNA in
screening for desired transgenic plants, for detecting mutations in the
gene, for monitoring upregallation of expression or changes in enzyme
activity in screening assays of compounds, for detecting any number of
allelic variants orthologs or paralogs of the gene, and site-directed
mutagenesis in eukaryotic cells. The DNA sequences are also useful for
recombinant expression of the encoded polypeptides and as immunogens for
preparing and screening antibodies. A transgenic plant comprising an
copiession cassette including a cell cycle regulatory gene is useful for
assaying enzyme agonists and antagonists, and as immunogens or antigens
to obtain antibodies. The antibodies are useful in assaying expression
clevels of cell cycle regulatory proteins for identifying and isolating
mucleic acids from other species, and for purification of the proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense oligonucleotide; p38 mitogen activated protein kinase; MAPK; antirheumatic; antiarthritic; immunosuppressive; cardiant; heart disease; antiinflammatory; autoimmune disease; rheumatoid arthritis; apoptosis; phosphorothioate; ss.
                                                                                   Nucleic acids useful for producing transgenic plants, preferably maize, with increased cell cycle gene activity, preferably activity of cyclin and/or cyclin-dependent kinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0.8%; Score 13.6; DB 1; Length 20; ilarity 80.0%; Pred. This invention relates to antisense compounds 8-30 nucleobases in length targeted to the 5'-untranslated region, translational start alte, translational start alte, translational termination region or 3'-untranslated region of a nucleic acid encoding a p18 mitogen activated protein kinase (MAPK), where the antisense oligonuclectides inhibit the expression of MAPK. Sequences AAC79501 represent human p18alpha MAPK and p18beta MAPK cDNA sequences. AAC79510 represent human p18alpha antisense oligonuclectides, while AAC79510 represent human p18alpha antisense oligonuclectides, while AAC79521 and AAC79521 and AAC79510 represent human p18alpha cDNA sequence AAC79523 and antisense oligonuclectides AAC79523 - AAC79531 and antisense oligonuclectides AAC79531 - AAC79537 and antisense oligonuclectides have antishense oligonuclectides are useful for inhibiting the expression of p18 MAPK in cells or tissues. The oligonuclectides are useful for inhibiting the expression of p18 mapk in a think hidseases such as inflammatory or autoimmune diseases e.g. rheumatoid arthitis, or heart diseases. The oligonuclectides are also useful for arthitis are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NPRS, non-ribosomal peptide synthetase; adenylation domain; A domain; PCR primer; antibiotic; immunosuppressant; cytostatic; antiviral; antihelminthic; fungicidal; ss.

The present invention describes a method of modulating bone resorption comprising administering leptin or a derivative under conditions suitable for the modulation of osteoclastogenesis. This is useful in the treatment of osteoporosis and paget's disease. No further information about this
                                                                                                                                                                                                                                                                                                             This invention describes a novel method for the targeted non-ribosomal synthesis of peptides (I) of required structure, comprising altering one or more A (adenylation) domain-encoding DNA segments (II) that encodes a non-ribosomal peptide synthetase so that the expression product of the altered (II) can produce (I), is new. Alterations in the A-domains are made according to a non-ribosomal code reproduced in the Specification. The method is used to synthesize (I) with antibiotic, immunosuppressant, cytostatic, antiviral, antihelminthic, fungicidal or surface-active properties, and to alter specificity and/or activity of known piologically active compounds, e.g. to improve thair solubility by replacing hydrophobic amino acids with hydrophilic ones, or vice verse. AAA97960-A97995 represent PCR primers used to illustrate the method of the invention. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modulating bone resorption in human or animal for treating osteoporosis or Paget's disease, comprises administering leptin, its derivative, homologue, analog, chemical equivalent, antagonist or agonist.
                                                                                                Non-ribosomal synthesis of peptides, e.g. antibiotics or immunosuppressants, using non-ribosomal peptide synthase with targeted modifications in adenylation domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bone resorption modulation; leptin; osteoporosis; Paget's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bone resorption modulation method related sequence SEQ ID NO: 1.

/note= "OTHER = F1 (CH2)6-PO-thymine, where F1 is flavine
                                                                                                                                                                                                                                                                                                 The invention relates to an antisense compound 8 to 30 nucleobases in length targetted to a nucleic acid encoding glycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder, a haematopoietic disorder, a hyperproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothioate antisense oligonucleotide targetted to human glycogen synthase kinase 3 alpha DNA
                                                                                                                                                                                                                          Antisense compound 8 to 30 nucleobases in length comprising a compound that is targeted to a nucleic acid molecule encoding glycogen synthase kinase 3 alpha, useful for the treatment of e.g. diabetes and hyperproliferative disorders.

The present invention relates to an analytical support, to which a number of oligonucleotides are fixed. The oligonucleotides are labelled with a fluorescent compound, the fluorescence of which varies when the oligonucleotide hybridises to its complement. The analytical support is useful in hybridisation testing for identification of specific nucleic acids, such as genomic sequencing, detecting mutations or pharmaceutical development. The present oligonucleotide was used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Support for hybridization analysis of nucleic acids for sequencing techniques, comprises an array of oligonucleotides having a label where the fluorescence changes follow hybridization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human bcl-6 phosphorothioate antisense oligonucleotide, SEQ ID NO:41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, bcl-6; transcriptional repressor; germinal centre formation, Th-2 mediated antibody affinity maturation, apoptosis regulator; chromosome 3q27; lymphoma, acute lymphoblastic leukaemia; post-transplant lymphoproliferative disorder; expression inhibition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0

sequences AAC81144-C81223 represent antisense oligonucleotides targetted to the human bcl-6 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human bcl-6 mRNA, and were analysed for their effect on bcl-6 mRNA levels by quantitative real-time PCR. Bcl-6 (also known as B-cell CLL/ lymphoma 6, zinc finger protein 51 and iLAZ3) is a sequence-specific DNA-binding transcriptional represers. The bcl-6 gene is expressed in germinal centre B- and T- cells and is required for germinal centre formation and Th-2 mediated antibody affinity maturation. Bcl-6 may also play a role in the region which undergoes a high frequency of translocation events. Such chromosomal translocations can result in aberrant forms of Bcl-6, which are strongly implicated in the pathogenesis of several types of lymphoma, and have also been reported in acute lymphoblastic leukaemia and post-transplant lymphoproliferative disorders. The oligonucleotides of the cinvention are useful for diagnosis, prevention and treatment of conditions associated with aberrant forms of bcl-6, such as lymphomas, acute lymphoblastic leukaemia and post-transplant lymphoproliferative disorders.
           Antisense compounds which specifically hybridize with and inhibit human bcl-6 expression, useful for treating bcl-6 related disorders, and preventing or delaying inflammation or tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel multiple tumor suppressor gene useful for diagnosing, prognosing and treating cancers, such as melanoma, leukemia, glioblastoma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; multiple tumour suppressor; MTS; cancer; gene therapy; ss.

The invention relates to antisense oligonucleotides, compositions and methods for modulating cot oncogene expression. The cot oncogene is also known as Tpl-2 and est. The compositions comprise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding cot oncogene. The antisense oligonucleotides are useful for associated with expression of cot oncogene and for treating diseases associated with expression of cot oncogene, e.g. inflammation, cancer of disorders of the immune system. The antisense oligonucleotides are also useful for diagnosis or prophylaxis or as research reagents and kits. The present sequence is human cot oncogene antisense oligonucleotide, ISIS 116381. This sequence was targetted towards the coding region of human

                                                                                                                                                                                        The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly M. (A.P.-tibose) polymerase plays an important role in chromatin decondensation, but a personation, but a discondensation, but a differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g architits) and diabetes. The present sequence is an antisense oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; PARP; Poly (ADP-ribose) polymerase; antisense oligonucleotide; cytostatic; nootropic; neuroprotective; antiinflammatory; antiidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; meningitis-associated intracranial complication; ischaemia; probe; inflammatory disorder; autoimmune disorder; arthritis; diabetes.
                                                                                                            Antisense compound useful for treating hyperproliferative, neurological, inflammatory and autoimmune disorders and diabetes inhibits human PARP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                   The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly And Parenase) palsays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and isolaemia), inflammatory and autoimmune disorders (e.g. arthritis) and diabetes. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human hnRNP A1 phosphorothioate antisense oligonucleotide, SEQ ID NO:46.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human hnRNP A1; heterogeneous nuclear ribonucleoprotein A1; heterogeneous nuclear ribonucleoprotein core protein A1; p40CRS; mRNA processing; transport; stabilisation; alternative splicing; donor splice site selection; telomere biogenesis; oncogenesis; apoptosis-associated protein; cancer; tumour formation; expression inhibition; phosphorothioate; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                     Antisense compound useful for treating hyperproliferative, neurological, inflammatory and autoimmune disorders and diabetes inhibits human PARP.

cother beterogeneous nuclear ribonnucleoprotein A1 (hnRNP A1) gene, which to the heterogeneous nuclear ribonnucleoprotein A1 (hnRNP A1) gene, which to the heterogeneous nuclear ribonnucleotides were designed to target different regions of the human hnRNP A1 mRNA, and were analysed for their effect on hnRNP A1 mRNA levels by quantitative real-time PCR. hnRNP A1 (also Known as heterogeneous nuclear ribonnucleoprotein core protein A1 and p400RS) is thought to function in the stabilisation, transport and processing (including alternative splicing) of newly and shuttles continuously between the nucleus and the cytoplasm acting as a carrier protein for mRNAs. InRNP A1 also participates in telomere a carrier protein for mRNAs in hnRNP correlating with shortened a carrier protein for mRNAs a laso been classified as an apoptosis telomeres. In addition, hnRNP A1 has also been classified as an apoptosis control splicing events, particularly donor splice site selection, hnRNP control splicing events, particularly donor splice site selection, hnRNP control simplicated in the process of oncogenesis. The oligonnucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with hnRNP A1 expression, such as cancer

This invention describes a novel conjugate (I) which consists of (A) a molecule to be transported and (B) at least one aryl residue of formula - (X - (Y - (Y + R))) in (II). Ar = group containing at least one aromatic ring; X = 0 or N (sic); X = 0 or N (sic); X = group containing at least one accomatic ring; X = 0 or N (sic); Y = 0, S or NHZ 2 (sic); R I = optionally substituted of the containing double and/or triple bonds); R 2 = optionally containing double and/or triple bonds; R 2 = optionally containing double and/or triple bonds; R 1 = integer of 1 or more. (A) is bonded to (B) directly or via a chemical group, provided that the chemical group; least one aryl residue (not restricted to containing a chemical group; R 2 = sective function at the invention also containing a reactive function at the position of the which (B'); by preparing (A') containing a reactive function at the position of the invention have cytostatic, proping (II) (optionally bonded via a chemical corporation and antiasthmatic activity and can be used for gene the invention have cytostatic, virucide, vasotropic, dermatological, antipsoriatic and antiasthmatic activity and can be used for gene therapy. Conjugation of (A) with (B) is useful for transporting (A) across biological membranes. The products of particularly tumor cells). Medicaments, diagnostic agents and test kits containing (I) are also claimed. Typically (I) are antisense or into enkaryotic or prokaryotic cells. (Specifically bacterial, yeast or mammalian cells, including human cells, containing (I) are also claimed. Typically (I) are antisense or into diagnostic agents and test kits containing (I) are also claimed. Typically (I) are antisense or into diagnostic agents and test kits containing (I) are also claimed. Typically (I) are antisense or into diagnostic agents and cellular uptake (C) (A), e.g. in tumor cells. (B) include fluorescein diactive to that obtained using other conjugates (I) are fluorescein diacetted (I) in the conjugates (I) are fluorescein diacetted (I) in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ) e.g. oligonucleotides conjugated with flüorescein diacetate (wscope of (B)) have superior uptake to corresponding fluorescein
New substituted aryl conjugates of parent molecules, especially oligonucleotides, having improved transmembrane and intracellular transport properties, useful as medicaments or diagnostic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.8%; Score 13.6; DB 1; Length 20;

therapy

The present sequence is mouse secreted Frizzled-related protein (sfrp3) gene specific reverse transcription PCR (RT-PCR) primer. The invention relates to a method for treating or preventing chronic obstructive pulmonary disease (COPD) such as emphysema, asthma and chronic bronchitis in a subject. The method involves administering to the subject, an agent effective to inhibit apoptosis by inhibiting the expression of a secreted Prizzled-related protein (sFRP) gene. It is also useful in antisense

Inhibition of apoptosis for the treatment or prevention of obstructive pulmonary disease comprises inhibiting expression of secreted Frizzled-

pulmonary disease comprises inhibiti related protein gene in lung cells.

The sequence represents PCR primer RP.2(rev) used in analysis of multiple tumour suppressor MTS1 and MTS2. The MTS genes, and expression products, are useful for treating, diagnosing or prognosing human cancer. In particular, the MTS gene is useful for diagnosing a predisposition to as a gene therapy for melanoma, leukaemia, astrocytoma, glioblastoma, hodghin's lymphoma, chronic lymphatic leukaemia (CLL), or cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach or rectum. The gene may be used in both cancerous and pre

relates to a method for treating or preventing chronic obstructive pulmonary disease (COPD) such as emphysema, asthma and chronic bronchitis in a subject. The method involves administering to the subject, an agent effective to inhibit apoptosis by inhibiting the expression of a secreted Frizzled-related protein (SFRP) gene. It is also useful in antisense

The sequence represents an FITC (fluorescein isothiocyanate) labeled cligonucleotide complimentary to part of the mRNA encoding the intracellular-adhesion molecule ICAM. The oligonucleotide is included in a composition comprising a fusion protein of herpes virus VP22 protein 159-301 (laving the transport function) and a cell-cycle progression regulator (or its DNA) e.g. BH3 or apoptotic proteins. The composition is used to reduce the proliferation of cells. The method of making the VP22 containing compositions is used for reducing proliferation of hyperproliferating cells e.g., cancer cells, for manufacturing a medicament to reduce or treat cell proliferation e.g. cancer cell proliferation. The method is also used for reducing or treating cell proliferation. The method is also used for reducing or treating cell proliferation, in tumour cells present in tumour cell mass, non-malignant cells e.g., benigh tumour cells such as genital warts, smooth muscle cells present in restencist, proliferating cells e.g., skin cancer, psoriasis or eczema skin cells, or proliferating cells e.g., skin cancer, psoriasis or Match 0.8%; Score 13.6; DB 1; Length 20; Local Similarity 80.0%; Pred. PCR primers AAH42977-80 were used to amplify k-ras DNA sequences. The primers are used in the method of the invention. The specification describes a method for screening genetic diseases. The method comprises using DNA simply extracted from a biological specimen such as scraped mucosal cells and tissue slide pieces fixed with formalin and embedded in paraffin, and amplifying a target region by polymerase chain reaction (PCR) for direct floursescence measurement of the additional doublestranded DNA intercalator. The method is used for detecting gene anomaly in e.g. infections diseases, congenital genetic diseases or cancers, including infection disease due to human papilloma virus and chlamydia genetic diseases like cystic fibrosis, mitochondrial cerebromyopathy, cancers of cervical cancer and colon cancer, through gene diagnosis in community screening test program
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulatory nucleic acid to a non-rodent subject is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine ritch (py-rich) or thymidine (1) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or or orthomyxoviridae), bacterial antigens (e.g. herpesviridae, retroviridae and/or or orthomyxoviridae), bacterial antigens (e.g. toxoplasma and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect in the contract of the packbone and to activate immune cells. Note: the

The present invention describes bases in the shape of a string, tape or circular disc on the surface of which a plural number of different ligands are immobilised respectively in pre-determined domains. Also described are devices for detecting the binding between the ligands and receptors and methods for detecting the binding between the ligands are useful for detection in biochemical and diagnostic assays. The ligands are immobilised in line, so the user only needs to determine the presence or absence of receptor binding, without further processing. AAH41135 to AAH41115 represent primers which are used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antileukoprotease; ALP; secretory leukocyte proteinase; SLPI; human; cancer marker; ovarian tumour; ovarian-derived metastatic tumour; overexpression; low malignant potential tumour; ovarian carcinoma; serous carcinoma; mucinous carcinoma; endometrioid carcinoma; elear cell carcinoma; cancer; diagnosis; cytostatic;
                                                                                                                                                                                                                               String, tape or disk shaped bases with several different immobilized ligands including nucleic acids, sugars, peptides and proteins.

The invention relates to methods for the diagnosis and treatment of ovarian tumours or ovarian-derived metastatic tumours in an individual. The diagnositic method involves measuring the level of antilenkoprotease (ALP) in a sample (e.g., a blood sample, tissue biopsy or ovarian secretion) from an individual. If the level of ALP exceeds the mean basal secretion from an individual is the level of ALP exceeds the mean basal constitutions, the individual is likely to have an ovarian or ovarian-constitution also known as secretory leukocyte protease inhibitor which specifically inhibits the activity of serratum corneum chymotryptic enzyme, and is also able to inhibit leukocyte elastise, cathepsin G, chymotrypsin and trypsin. It is significantly overexpressed in carcinomas methods of treating ovarian or ovarian-derived tumours, or preventing covarian tumour metastasis, via the administration of ALP. Methods of the ovarian and ovarian-derived metastatic tumours, particularly low malignant potential tumours or ovarian carcinomas such serous carcinoma. Consuminous carcinoma, endometriod are ovarian carcinoma, endometriod carcinoma, endometriod carcinoma and clear cell carcinoma. Sequences AAH23847-AAH23850 represent PCR primers used in quantitative consumed and cancerous ovarian tissue levels of ALP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                               Detecting tumor growth in an individual, particularly ovarian and ovarian derived metastatic tumors, comprises measuring antileukoprotease levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated unedited human excitatory amino acid 4 receptor polynucleotides and proteins, useful for screening potential therapeutic compounds and

human excitatory amino acid (EAA) 5 receptor. The synthesis this central nervous system (CNS) receptor in vivo is regulated by an editing mechanism. This editing results in the expression from a single human CNS receptor game of structurally distinct forms of the CNS receptor protein. The specification describes a human EAA4 receptor. The human excitatory EAA4 receptor polymuclacotide and the protein it encodes are useful for screening potential therapeutic compounds and selecting drug candidates that interact selectively with edited human central nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse; multiple tumour suppressor; MTS; cytostatic; somatic mutation; germ line mutation; gene therapy; melanoma; leukaemia; astrocytoma; CLL; glioblastoma; lymphoma; glioma; Hodgkin's lymphoma; cancer; rectum; P16; pancreas; breact; thyroid; ovary; uterus; testis; kidney; stomach; mouse; P16beta; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel regulatory sequences (A) derived from human fassin that provide specific expression in dendritic cells (DC) and which have antiviral, antibacterial, antifungal, antiparasitic, anti-allergic, neurological, immunomodulatory and apoptotic activity. (A) are used to regulate expression of antigens, immunoregulators, antisense sequences etc. in DC-specific fashion. Recombinant DNA, vectors and host cells that contain (A) are useful: (i) in vaccines against viruses. bacteria, fungi, parasites, tumors, allergens and plaques in Creutzfeld-akoko and Alzheimer's disease; and (ii) for gene therapy of tumors, allergies, infections, autoimume diseases and transplant rejection. They can also be provide specific expression of antigens and immunoregulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New regulatory sequences from the fascin gene, useful for providing dendritic cell-specific expression of e.g. antigens, e.g. for vaccination against tumors and infections.
including gene therapy, protein replacement therapy, and protein mimetics. The MTS sequences are useful for diagnosing predisposition to human cancer or for diagnosing and prognosing human cancers such as melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum. They are also used for screening drugs for cancer treatment. The present sequence is pl6-specific reverse PCR primer used for amplifying mouse Pl6beta cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antibacterial; antifungal; antiparasitic; anti-allergic; neurological; immunomdularory; apoptotic; expression regulator; vaccine; allergen; Creutzfeld-Jakob disease; Alzheimer's disease; gene therapy; autoimmune disease; transplant rejection; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fascin; regulatory sequence; human; dendritic cell; antiviral; tumor;

A new protein is described which comprises the 318 residue amino acid sequence corresponding to wild type retinol dehydrogenase (RDHS), but where amino acid 238 is not Gly, amino acid 73 is not Ser, or amino acid 33 is not Ile. This mutant RDHS can be used in the analysis of mutations in the gene encoding retinol dehydrogenase, in the diagnosis and treatment of ocular diseases associated with retinal degeneration such simple subjunctatus. Other disorders which may also be studied include fundus albipunctata albescens, albipunctate dystrophy and retinitis pigmentosa. A number of primer pairs (See GENSEEQ records AAA5443). A54448) were used to amplify the genomic RDHS DNA. Two primers (AAA54441, AAA54442) were used to amplify exon 3b of the RDHS gene. This primer corresponds to nucleotides 3151-3170 of the genomic DNA sequence (See GENESEQ record AAA5441).
in DC; for isolation and identification of cell factors and cis-elements from regulatory sequences that mediate DC-specific expression; to determine the degree of maturity of DC and to block transcription factors, by providing binding sites in DC. (A) provide DC-specific expression of nucleic acid under their control, allowing a more specific regulation of the immune response and eliminating the long and laborious purification of DC (since a complete leucocyte population may be transformed), including transformation in vitro. This sequence represents a primer associated with the human fascin gene described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mutations in nucleic acid molecules encoding 11-cis retinol dehydrogenase correlated to ocular disorders, useful in diagnosis and treatment of diseases such as fundus albipunctatus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            11-cis retinol dehydrogenase; RDH5; eye; mutant; mutation; ocular disease; fundus albipunctatus; retinitis punctata albescens; albipunctate dystrophy; retinitis pigmentosa; human; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New multiple tumor suppressor 2-specific antibodies useful for detecting differences in the absence of the peptides or mutant gene products, or for screening tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an antibody or its fragment that specifically binds to a human multiple tumour suppressor (WTS). The invention is useful for detecting differences in the absence of MTS peptides, to screen a tissue or to detect mutant MTS gene products. The antibodies will immunoprecipitate MTS proteins from solution as well as react with MTS protein on Western or immunoblots of polyacrylamide gels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes a method for detecting a mutation at a particular position in a target nucleic acid. The method comprises binding the target to a solid support, hybridizing a probe to the target, elongating the probe with nucleotide(8) resistant to exonuclease, digesting the probe with accounclease and detecting bound nucleic acid. The mutation is in position 'n' in a target nucleic acid and the 3' extremity of the probe hybridises to position 'n'. The method is used to detect gene mutations implicated in disease, particularly hereditary genetic diseases, especially sickle cell anemia alpha and beta cancer. The present sequence represents a probe which is used in the method of the invention to detect a mutation in codon 12 of K-ras
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, phosphofructokinase isozyme-2; iPFK-2; therapy; drug screening;

The present invention relates to a method for screening a candidate therapeutic agent that inhibits kinase enzymatic activity of phosphofructokinase isozyme (IPRA-2). Phosphofructokinase catalyses the formation of fructose 2,6-biphosphate from fructose-6-phosphate. The method is used for identifying compounds that may be used to inhibit iPPR-2 activity, an enzyme that is over-expressed by cancerous cells. IPRK-2 is useful as diagnostic targets, drug screening targets and as antisense compounds that inhibit inflammation, cachexia and its translation in callular cytosol as an anti-tumour treatment. The present sequence is human phosphofructokinase isozyme (IPRK-2) DNA specific phosphorothicate sequence is sense oligonuclectide (S-IPRF-2) used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human iPFK-2 DNA specific phosphorothioate antisense oligonucleotide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, phosphofructokinase isozyme-2; iPPK-2; therapy; drug screening;

The present invention relates to a method for screening a candidate therapeutic agent that inhibits kinase enzymatic activity of phosphofructokinase isozyme (IPFK-2). Phosphofructokinase catalyses the formation of fructose 2,6-biphosphate from fructose-6-phosphate. The method is used for identifying compounds that may be used to inhibit iPFK-2 activity, an enzyme that is over-expressed by cancerous cells. iPFK-2 is useful as diagnostic targets, drug screening targets and as antisense compounds that inhibit inflammation, cachexia and its translation in cellular cytosol as an anti-tumour treatment. The present sequence is human phosphofructokinase isozyme (iPFK-2) DNA specific phosphorothioate antisense oligonucleotide (AS-iPFK-2) used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Solute carrier family 6 neurotransmiter transporter; sectonin 4; SLC6A4; genotyping; allele specific oligonuclectide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 gene for identifying drugs for treating disorders related to expression
                                                                                                                                                                                          Screening for agents which inhibit the activity of the oncogenic phosphoglucomutase isozyme-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

PCR primer used to amplify cDNA encoding a rat mu-subtype opioid receptor. The polynucleotide sequence is useful for producing a mu-type opioid receptor by standard recombinant techniques. The encoded protein is useful for producing monoclonal or polyclonal anti-receptor antibodies and to identify patterns of post-translational modifications and to elucidate associated G proteins. Mu receptor polynucleotides and solypeptides are useful in identifying other receptor subtypes, in screening for new opioid ligands and for understanding mechanisms of opioid action e.g., drug addiction
                                                                                                                                                                                                                                                                                             ö
                                                                   The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotronin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a general protein organization or structure analysis and binding studies. A composition comprising a

New DNA-peptide nucleic acid chimeras, useful e.g. as antisense agents for treating e.g. cancer, also as diagnostic probes and primers.

Disclosure; Page 24; 54pp; German.

This invention describes novel polyamide-oligonucleotide derivatives (I) and their physiologically acceptable salts of formula P((DNA-LI)_g(PNA-LI)_g(PNA-LI)_g(DNA-LI)_g(PNA-LI)_g(DNA-LI)_g(PNA-LI)_g(DNA-LI

more active than either DNA or PNA oligomers. When used as probes, (I) show different responses to base-pair mismatches in the DNA and PNA segments, allowing better discrimination between pathogenic and non-pathogenic conditions such as the transition from proto-oncogene no oncogene, also, when used as primers, with the PNA segment at the 5'-end, they produce amplicons resistant to 5'-exonuclease, allowing this enzyme to be used to eliminate RNA or DNA primers. The DNA component allows additional reactions not possible with PNA alone, e.g. 3'-tailing and (I) may be incorporated into a gene. AAH49208-AAH49264 represent oligonucleotides used to illustrate the method of the invention 888888888888888

Identifying a nucleic acid having a sequence capable of targeting a gene of interest, for identifying nucleic acids for gene therapy, comprises using the Nearest-Neighbor Thermal Stability Program.

Example 1; Col 21-22; 43pp; English.

The present invention describes a method for the identification of a nucleic acid having a sequence capable of targeting a gene of interest compiratises: (a) a first database having a list of stability values for independent combinations of N(x); (b) a computing unit having a means for independent combinations N(x), data list, defining a nucleic acid sequence of interest to be targeted to provide a second database; and (c) sequence of interest. The method is useful for identifying a nucleic acid having a stability value of a nucleic acid sequence capable of targeting the gene of interest. The method is useful for identifying a nucleic acid having a sequence capable of targeting a gene of interest. The method may be used to obtain thermodynamic parameters for 20 combinations of nearest-neighbour base pairs of DNA:RNA hybrid sequences. The Nearest-Neighbour Thermal Stability Program can process data for use in

```
calculating thermal melting temperatures for phosphorothioate DNA:RNA hybrids. The program can be readily extended to predict the most stable triplex-forming sequences, or antigene oligomers. The present sequence represents a DNA 20-mer ASO (antisense DNA oligomer) sequence which is used in the exemplification of the present invention

Identifying a nucleic acid having a sequence capable of targeting a gene of interest, for identifying nucleic acids for gene therapy, comprises using the Nearest-Neighbor Thermal Stability Program.

Detecting collagen gene alteration, useful for diagnosing osteoporosis, multiple epiphyseal dysplasia, osteogenesis imperfecta, shortness of stature and low bone density in humans.

Claim 8; Fig 24; 617pp; English.

Example 1; Col 25-26; 43pp; English.

The present invention describes a method for the identification of a nucleic acid having a sequence capable of targeting a gene of interest comprises: (a) a first database having a list of stability values for independent combinations of N(x); (b) a computing unit having a means for inputting data comprising N(x), data list, defining a nucleic acid sequence of interest to be targeted to provide a second database; and (c) a program capable of processing the first and second database to N(x) comparison, and a stability value of a nucleic acid sequence capable of targeting the gene of interest. The method is useful for identifying a nucleic acid having a sequence capable of targeting a gene of interest. These mucleic acids are useful in gene therapy and disease treatment. The method may be used to obtain thermodynamic parameters for 20 combinations of nearest-neighbour base pairs of DNR:NR hybrid sequences. The Nearest-Neighbour Thermal Stability Program can process data for use in calculating thermal melting temperatures for phosphorothicate DNA:RNA hybrids. The program can be readily extended to predict the most stable program can be readily extended to predict the most stable triplex-forming sequences, or antigene oligomers. The present sequence represents an antisense DNA oligomer designated S-ASO targeted to the

The invention relates to Detecting a collagen gene alteration associated with a pathological condition in a human subject by obtaining from the subject a sample nucleic acid containing a portion of at least 15 consecutive nucleotides of the segment of the COLIA1 gene extending in the 5' to 3' direction from 78 nucleotides of intron 27 located adjacent exon 28 through the 3' end of intron 17, where the portion contains an intronic nucleotide and a first and second site, determining the sequence of the portion contains an intronic nucleotide and a first and second site, determining the sequence of the portion with the corresponding consensus sequence of the COLIA1 gene where a difference between the sequence of the portion and the consensus sequence indicates the presence of the collagen alteration in the subject. The method is used for detecting abnormalities in a COLI or COL9 gene is useful for determining whether a subject is afflicted with pathological conditions associated with an altered collagen gene such as osteoporosis, multiple epithyseal dysplasia, osteogenesis imperfecta, shortness of stature and consumently in a collagen gene is also useful for designing a therapeutic nucleotide or gene therapy agent which can be administered to the subject to correct or alleviate the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           'note= "C is covalently linked to a fluorescein moiety"
                                                                                                                                                                                                                                                                                                                                                         VP22; viral protein 22; ss; cytostatic; antipsoriatic; dermatological; disasgregating agent; Aluminium phthalocyanine; cell proliferation; apoptosis; psoriasis; eczema; skin cancer; restenosis; scarring; Intracellular-adhesion molecule; ICAM.
abnormality. The method is useful for detecting mutations in both the coding and non-coding sequences of any of the COLI or COL9 genes. Therefore the method can be used to detect collagen gene alterations which affect either the primary sequence of a collagen protein chain, splicing of the mRNA encoding such chains or regulation of expression the genes encoding such chains. The present sequence is a PCR primer which amplifies a nucleic acid from a collagen gene of the invention

prevent their proliferation and/or kill them comporising: (a) exposing the cells to the aggregate composition cited above; and (b) exposing the disaggregation of the aggregate cited above; which can promote disaggregation of the aggregate composition in cells, where steps (a) and the aggregate composition and the disaggregating agent, as combined preparation for administration of these components, either sequentially or together, a pharmaceutical comprising the aggregating agent composition and cort disaggregating agent, in combination with a pharmaceutical excipient and a cell preparation obtainable by treating the target cells in vitro as cited in the method above. The aggregate composition and treating diseases or target cells, and/or preventing cell proliferation cort creating diseases or target cells, and/or preventing cell proliferation and creating therapy, or as a medicament for delivering medicaments for useful in therapy, particularly for manufacturing medicaments for use in therapy, or as a medicament for delivering molecules to cells to prevent cell proliferation or kill cells. In particular, these may be used for treating psoriasis, eczema, skin cancer, restenosis and scarring. The composition code present sequence is an oligomuche encoding an Intracellular-adhesion contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to detecting (MI) infection by human herpes virus (HW) by performing informatics analysis of gene sequences from different HHV types or strains (e.g. HHV)-HHVS) to identify target segment (TS), selecting probe and primers capable of directing amplification, amplifying TS, interpolating HHV number by comparing number of amplification cycles (NAC) for detecting TS to NAC to detect known quantity of TS. Also included are cloning a segment of genomic viral DNA
                                                                                                                                           The present invention relates to peptide nucleic acid (PNA) derivatives having at the C-, and optionally N-, terminus one or more phosphoryl groups, at least one of which contains one or more deprotonisable groups, preferably hydroxy or mercapto. These PNAs are useful in the treatment of tumours or any disease associated with (over) expression of particular genes, including viral infections, vitiligo or other pigmentation disorders, and asthma. The present sequence is a peptide nucleic acid described in the exemplification of the invention
                                New peptide nucleic acid derivatives, useful e.g. for tumor treatment and diagnosis, contain terminal, deprotonizable phosphoryl groups for e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting infection of human herpes virus type or strain by informatic analysis of gene sequence using probe and primers capable of directing amplification of target sequence and interpolating the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human herpes virus infection; ss; real time PCR; primer; HHV1; HHV2; HHV3; HHV4; HHV5; HHV6; HHV7; HHV8; latent membrane protein-1; LMP-1; nuclear protein EBNA2; intermediate early protein; IE; glycoprotein B;

The invention relates to a marker for testing analogues of vitamin D expected to be effective in reducing aberrant activity of vitamin D responsive cell, comprises at least one gene pertinent to the action of vitamin D for testing analogues and determining analogues capable of regulating the gene, and is indicative of a chemopreventive or chemotherapeutic again. The invention is useful for testing analogues of vitamin D expected to be effective in reducing aberrant activity of vitamin D-responsive cell or for testing analogues of vitamin D suspected to have antipizoliferative activity. The invention is useful for reducing aberrant activity of vitamin D-responsive cell, and for treating a disorder characterised by an aberrant activity of vitamin D-responsive cell, where the disorder is selected from cancer, psoriasis, multiple cell, where the disorder is selected from cancer, psoriasis, multiple cell, where the disorder is selected from cancer, psoriasis, multiple cell, where the disorder is selected from cancer, psoriasis, multiple cell, where the disorder is selected from cancer, psoriasis, multiple cell, where the disorder is useful for identifying regulated the invention is useful for protecting against in vivo DNA damage to the skin of a mammal, or for reducing or preventing DNA damage to the skin of a mammal, preferably human. The invention is useful as a marker for the activity of DNA repair mechanisms. The invention is useful as a marker for the activity of DNA repair minibiting an enzyme which metabolises 1.25-dihydroxyvitamin D3 The invention is useful for testing compounds susceptible of inhibiting an enzyme which metabolises 1.25-dihydroxyvitamin D3 The invention is useful for treating epidermal wounds. The present sequence invention is useful for treating epidermal wounds. The present sequence is collagenase 1 gene specific RT-PCR primer
                                          Novel marker for testing analogs of vitamin D expected to be effective in reducing aberrant activity of vitamin D-responsive cell, comprises gene pertinent to action of vitamin D for testing the analogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.8%; Score 13.6; DB 1; Length 20;

                                                                                                                                            The invention relates to the screening of antitumour agents by using the interaction between ARP protein and HK33 (Housekeeping 33) protein.

Nuclear transport of ARF protein is inhibited by the expression of HK33 gene, and thus p53-dependent transcription is suppressed. In immortalised cells, moreover, the expression of HK33 gene is significantly elevated. The invention provides a method of screening an antitumour agent by using the interaction between ARP protein and HK33 protein. It also provides a method for utilisation of HK33 protein and agene encoding it in the examination of tumour related disease. The current sequence represents a ARF/HK33 protein related primer
delivery of therapeutic agents, for inhibiting angiogenesis, tumor growth or pregnancy, and for inducing apoptosis or weight loss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "Chimeric phosphorothioate oligonucleotide having 2'-methoxyethyl (2'-MOE) wings"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Dean NM;

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule (II) encoding a natural dominant negative regulator of caspase 8, FilP-c, where (I) specifically hybridises with and inhibits expression of the protein, or specifically hybridises with at least an 8-nucleobase portion of an active site on (II). (I) has antiinflammachory and anti-tumour activities. (I) is an inhibitor of FilP-c expression, a modulator of apoptosis and can be used in antisense gene therapy. (I) is useful for inhibiting the expression of FilP-c in cells or tissues, and for treating an animal having a disease or condition associated with FilP-c. (I) is also useful for modulating apoptosis in a cell, where a caspase such as caspase 8, caspase 3 or caspase 7 is activated, and the FilP-c is the long form of FilP-c. (I) is also useful for diagnostics, therapeutics, prophylaxis, as research reagents and kits, for distinguishing functions of various members of biological pathway, and in antisense gene therapy. (I) is also useful brophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence represents mouse FilP-c inhibiting chimeric phosphorothylactically in four formation. The present sequence represents mouse FilP-c inhibiting command of the prophylactic phonomial or command the command of the prophylactic phonomial or command the command of the prophylactic phonomial or command the command or command the command or command the command or command the command or wings, which is used in an example from the present invention

Examination of aspermia comprising investigating an allele with correlation to aspermia if it is detected in the HLA-DQA1 locus.

Example 2; Page 4; 7pp; Japanese.

The present invention describes a method for the examination of aspermia in which, if an allele showing correlation to aspermia is detected in the human leukocyte antigen (HLA)-DQA1 locus, it is investigated. Also described is a method for the examination of aspermia in which one of the following (a) to (e) is investigated: (a) if the base sequence of the DNA corresponding to codon 64 of HLA-DQA1 gene is AGA; (b) if the base sequence of the DNA corresponding to codon 66 of HLA-DQA1 gene is ATG; (c) if the base sequence of the DNA corresponding to codon 69 of HLA-DQA1 gene is GTG; (d) if the base sequence of the DNA corresponding to codon 69 of HLA-DQA1 gene is GTG; (d) if the base sequence of the DNA corresponding to codon 69 of HLA-DQA1 gene is GTG; (d) if the base sequence of the DNA corresponding to codon 69 of HLA-DQA1 gene is GTG; (d) if the base sequence of the DNA corresponding to codon 69 of HLA-DQA1 gene is GTG; (d) if the base sequence of the DNA

ö
corresponding to codon 71 of HLA-DQA1 gene is GTG. The method is useful for the examination of aspermia. The present sequence represents a PCR primer for the HLA-DQB1 locus, which is used in an example from the present invention

Claim 14; Page 91; 239pp; English.

The invention relates to an isolated polypeptide, comprising a variant for form is associated with altered preference for carbohydrates, other sweeteners or ethanol.

The polypeptide and its associated DNA sequence can be produced by recombinant techniques and its useful for preventing obesity, disbetes or alcoholism associated with SACI expression. The sequences are useful in screening for drugs and sweeteners. Recombinant call lines and transgenic correcting for drugs and sweeteners. Recombinant call lines and transgenic morpor may be used in screening for and identifying agents that induce or repress function of SACI. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human such as blood, pancreas or tongue) for sequence variations of the SACI gene. A sequence variation of the SACI locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a predisposition to diabetes, obesity and/or alcoholism and may provide a sample by contacting the DNA with a probe to form a hybridiaation complex which is then detected. The sequences represent cDNA encoding human and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      highest expression gene group consisting of 100 genes which show the highest expression among the genes expressed in human maturation/ activation DC. Also described are: (1) a protein expressed by the above human maturation/activation DC expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnosis of various human diseases related to human DC. ABL42927 to ABL42956 represent PCR primers for human maturation/ activation DC expression genes, which are used in the exemplification of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              modulating the expression of human glioma-associated oncogene-1. The antisense compounds, particularly antisense oligomucleotides, target and inhibit the expression of human glioma-associated oncogene-1. The antisense compounds are useful for inhibiting the expression of human glioma-associated oncogene-1. The glioma-associated oncogene-1 in human cells or tissues and for treating an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of glioma-associated oncogene-1. The compounds are useful for diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. The antisense compounds are safely and effectively administered to humans. ABK10509-ABK30586 represent the antisense oligomucleotides of the invention which comprise a phosphorothioate backbone
                                                     Human glioma-associated oncogene-1 antisense oligonucleotide ISIS 124842.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Angiogeneeis inhibitor; ss; angiogeneeis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint;

```
administering at least one antianglogenic nucleic acid molecule. Also nucleic acid sa kit comprising a first container housing the antianglogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted anglogenesis. The method is tuesful for inhibiting anglogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, conneal graft rejection, neovascular glaucoma, retrolencal fibroplasia, neovascularisation, telangiectasia, haemophiliac joints, anglofibroma, wound gramulation, intestinal adhesions, atherosclerosis, scleroderma and acid of the invention
                                                                                                                                                                                                                                                                                                         Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to inhibiting angiogenesis in a subject,

The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, olon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, kodgkin's lymphoma, nalanoma, myeloma, oral cavityr cancer, oversidan cancer, pancreatic cancer, prostate cancer, rabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the

The present invention relates to peptide nucleic acid (PNA) derivatives. These can be used in the treatment of cancer, viral infections, vitiligo or other pigmentation disorders, and asthma. The present sequence is an oligonucleotide fragment of a PNA described in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to the cDNA and protein sequences of novel proteins HYPIND1 or FCHL1 and to sequence variations within these genes that have been shown to be associated with lipid disorders.

Oligonucleotide probes that hybridise to the CDNA sequence are useful for analysing the expression of FCHL1 by detecting the expression of the mRNA transcript in the sample. A host cell transformed with the CDNA of the invention is useful for producing the protein by recombinant means. Pharmaceutical compositions based on the sequences of the invention are useful for treating or preventing a lipid disorder associated with expression of FCHL1 such as familial combined hyperlipidaemia, coronary extery disease, atherogenic lipoprotein phenotype attacks of coronary extery disease, atherogenic lipoprotein phenotype familia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse; primer; antilipaemic; cardiant; hypotensive; anorectic; HYPLIP1; FCHL1; lipid disorder; familial combined hyperlipidaemia; coronary artery disease; atherogenic lipoprotein phenotype; cancer; hyperapobetalipoproteinaemia; hypertriglyceridaemia; obesity; ss; familial dyslipidaemic hypertension; syndrome X; insulin resistance; hypercholesterolaemia; chromosome 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel HYPLIPI and FCHL1 genes and their sequence variations associated with lipid disorder and cancer, useful for prognosis, diagnosis and treatment of lipid disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                    The present invention relates to antisense oligomucleotides and methods for modulating the expression of human or mouse Protein Phosphatase 2 catalytic subunit alpha. The antisense oligomucleotides are useful for inhibiting the expression of Protein Phosphatase 2 catalytic subunit alpha and for treating diseases or conditions associated with aberrant expression of Protein Phosphatase 2 catalytic subunit alpha and for treating diseases or conditions associated with aberrant diseases include diabetes and cancer. The antisense oligomucleotides are also useful for diagnostics, therapeutics, and prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. They are also useful as research reagents for distinguishing between functions of various members of a biological pathway. ABS65400-ABS65477 represent human or mouse Protein Phosphatase 2 catalytic subunit alpha antisense oligonucleotides which comprise a phosphorothioate backbone
                                                                                                        New antisense oligonucleotides targeted to nucleic acid encoding Protein Phospharase 2 catalytic subunit alpha, useful in treating diseases associated with the aberrant expression of Protein Phosphatase 2 catalytic subunit alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide nucleic acid, PNA, polyamide backbone; phosphoryl radical; cytostatic; virucide; dermatological; antiasthmatic; cancer; antisense; viral infection; vitiligo; pigmentation disorder; asthma; ss.

The invention relates to a compound of 8-50 nucleobases in length targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where the compound specifically hybridises with and inhibits the expression of PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a compound of 8-50 nucleobases in length which specifically hybridises with an a nucleobase portion of an active site on a nucleic acid encoding PTP1B; (2) inhibiting the expression of PTP1B in cells or tissues comprising contacting the cells or tissues with the compound; treating an animal having or usupected of having a disease or condition associated with PTP1B comprising administering the compound; (4) decreasing blood sugar levels in an animal comprising administering the compound; (5) preventing or delaying the onset of a disease or condition associated with PTP1B in an animal comprising administering the compound; (6) preventing or delaying the onset of an increase in blood glucose levels
identify a molecule which enhances or decreases the HYPLIP1 or FCHL1 activity. The present sequence represents an oligomucleotide primer specific for the mouse HYPLIP1 locus of the invention. The mouse HYPLIP1 locus is situated on chromosome 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Compound for inhibiting the expression of protein phosphatase 1B (PTP) and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTP1B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense; protein phosphatase 1B; PTP1B; se; probe; human; type 2 diabbetes; obseity; ovarian cancer; chronic myeloid leukaemia; hyperproliferative disease; antidiabetic; anorectic; cytostatic; blood glucose; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Freier SM, Monia BP, Butler MM, Mckay R;

in an animal comprising administering the compound. The compound is used to inhibit the expression of PTPLB in cells or tissues, to treat or prevent or delay the onset of a disease or condition associated with PTPLB, such as type 2 diabetes, obesity, cancer (especially ovarian cancer, chronic myeloid leukaemia and hyperproliferative diseases in an animal having or ususpected of having the disease or condition, and for decreasing blood sugar levels or preventing or delaying the onset of an increase in blood glucose levels in an animal. The compound is also used kits. The present sequence is an antisense compound of the invention targetting human PTPLB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antisense compound targeted to nucleic acid encoding Fas, Fas
ligand or Fas associated protein-1 is useful for inhibiting expression of
Fas, Fas ligand, or Fap-1 in cells or tissues, and for treating
hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to an antisense compound encoding Fas, Fas ligand, or Fas associated protein-1 (Fap-1). The inhibition of Fas mediated signalling is thought to be immunosuppressive, antiinflammatory, heparotropic, cytostatic and vasotropic. Antisense oligonucleotides were designed to target human Fas. Oligonucleotides were synthesised as chimaric oligonucleotides and are useful for treating an animal having an autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia reperfusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonucleotide. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, immunosuppressive; antiinflammatory; hepatotropic; cytostatic; vasotropic; hepatitis; cancer; allograft rejection; ds; Fas.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to antisense oligonucleotides of at least 10 bases complementary to inducible human phosphofructokinase-2 (iPFK-2) cDNA. The antisense oligonucleotides can be included in anticancer or antiinflammatcry pharmaceutical compositions along with an oligonucleotide carrier. An iPFK-2 antisonist such as an enzymatic inhibitor, anti-iPFK-2 antibody, or iPFK-2 antisense molecule can be administered for treating inflammatory disease or rapidly-growing cancers. The present sequence represents an iPFK-2-specific sense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense oligonucleotides useful for treating inflammatory diseases or cancers, comprises complementary sequence of inducible human
oligonucleotides are used in diagnostics, therapeutics, prophylaxis and as research reagents and in kits. The oligonucleotides are also useful for research purposes. The present nucleotide sequence is related to
                                                                                                                                                                                                                                                                                iPFK-2-specific oligonucleotide S-iPFK-2 (A) (sense, position 35-55).

The invention relates to antisense oligonucleotides of at least 10 bases complementary to inducible human phosphofructokinase-2 (1PFK-2) cDNA. The antisense oligonucleotides can be included in anticancer or antiinflammatory pharmaceutical compositions along with an oligonucleotide carrier. An iPFK-2 antagonist such as an enzymatic inhibitor, anti-iPFK-2 antibody, or iPFK-2 antisense molecule can be administered for treating inflammatory disease or rapidly-growing cancers. The present sequence represents an iPFK-2-specific antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel antisense oligonucleotides useful for treating inflammatory diseases or cancers, comprises complementary sequence of inducible human phosphofructokinase-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates i(b) a primer described based on the chromsome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal overseponding to the marker is detected from the resultant plates containing the clones having said marker sequence; (d) the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal discrimination Nos. are mixed respectively in each wells of longitudinal resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL4257 to ABL45322 represent represent FOR primers for human chromosome 124221, which are represent for human chromosome 124221, which are represent corporation in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates independ for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. gucceed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal discrimination Nos are mixed respectively in each wells of longitudinal creation Nos are mixed respectively in each wells of longitudinal discrimination Nos are mixed respectively in each wells of longitudinal creation the amplified products; (h) the clones in the multiwell plates are specified from the detected fromes are cultured and the created from the detected soult; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABI45357 to ABI45322 represent represent POR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel antisense compound for modulating expression of human helicase-moi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention comprises antisense oligonucleotides which are targeted to the coding region of the human helicase-moi gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of human helicase-moi in cells or tissues, and for treating a helicase-moi-associated condition. The antisense oligonucleotides of the invention may also be used to delay infection, inflammation and tumour formation. The present DNA sequence represents a human helicase-moi gene antisense oligonucleotide of the invention. NOTE: The present DNA sequence has a phosphorothioace backbone, bases 1-5 and 16-20 are 2'-methoxyethyl (2'-MOE) nucleotides
and for treating inflammation, specifically hybridizes to a specific region in nucleic acid molecule encoding the human helicase-moi.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20 BP; 3 A; 3 C; 7 G; 7 T; 0 U; 0 Other;

Culturing cells such as neuronal cells for use in treating neurological disorders, comprises generating embryoid bodies from undifferentiated embryonic stem cells, selecting precursor cells, expanding and differentiating them.

Example 10; Page 40; 66pp; English

The invention provides a method of culturing cells. The method involves expanding a culture of undifferentiated embryonic stem (ES) cells, generating embryoid bodies (EB), culturing the bodies to select for central nervous system (CNS) precursor cells (PC), culturing PC in an

expansion medium comprising a neurologic factor, and differentiating and culturing the expanded PC to form a culture of differentiated neuronal cells useful for culturing undifferentiated SS cells to form differentiated sscalls to form differentiated neuronal cells which are useful for treating a neurological disorder, especially Parkinson's disease in a patient. A gene product such as tyrosine hydroxylase, nerve growth factor (NDF), brain derived neurotrophic factor (BDNF), brGF, glial derived growth factor (GDNF) NT-3, and NT-4/5 can be introduced into a brain of a subject. The method is useful for culturing dopaminergic, cholinergic and service neuronal cells. The differentiated neuronal cells are useful for treating neurological disorders such as Euntington's disease, alreading epilepsy, familial dysauconomia as well as injury or trauma to the nervous system such as neurotoxic injury or disorders of mood and such as stroke and CNS disorders insuling from aging. Assays are useful for developing drugs capable of regulating the survival, profileration or comprise 20-40% dopaminergic neurons and 1-3* astroytes are useful for studying the mechanism of neuronal cells and to screen for an anging. Assays and selection neuronal cells and to screen pristing 50* 85* neurons which companies of neuronal cells and to screen for agonist of studying the mechanism of neuronal cells and release, particularly for serotonin and dopamine, neuronal cell survival, and the electrophysiochemical properties of differentiated neuronal cells.

The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing accondany structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent enemptication of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 20 BP; 2 A; 14 C; 0 G; 4 T; 0 U; 0 Other;

New mutated eukaryotic initiation factor 2 alpha kinase 3 genes and polypeptides in patients with Wolcott-Rallison syndrome, useful for preventing or treating e.g. diabetes, osteoporosis, arthritis or mental

Example 4; Page 31; 93pp; English.

The invention relates to an isolated variant of a mammal genomic sequence of the gene coding for the translation initiation factor 2 alpha kinase 3 (EIPIZAK3). The EIPIZAK3 nucleic acid variant is useful for the production of a recombinant or synthetic polypeptide, and for screening compounds capable of modulating EIPIZAK3. The nucleic acid is also useful for

screening or diagnosing the diseases cited below. The nucleic acid of may be used as sense or anti-sense oligonucleotide. The nucleic acid may also be used as primer or a probe, for detecting and/or amplifying a nucleic acid sequence. The compound is useful as a medicament, particularly for a roid sequence. The compound is useful as a medicament, particularly for preventing and/or treating diabetes and/or pathology related to WRS, e.g. type I diabetes, type 2 diabetes, the others forms of diabetes, c.g. cype 2 diabetes, the others forms of diabetes, c.g. creal dysfunction, or mental retardation, nephropathies or other can dysfunction, or mental retardation. The cell the mammal or the ETP2AX3 protein, and the direct or indirect interactions between the ETP2AX3 protein, and chemical or biochemical compounds, which may be a supersection of the tell for screening chemical or biochemical compounds capable of interacting directly or indirectly with the ETP2AX3 protein, and/or interacting the expression or the activity of the ETP2AX3 capable of modulating the expression or the activity of the ETP2AX3 coding sequences and the protein. ABX24521-ABX24624 represent human ETP2AX3 coding sequences and the primers of the invention ö Gaps ö 0.8%; Score 13.6; DB 1; Length 20; 80.0%; Pred. Composition comprising nucleic acid molecules and a oligonucleotide capable of hybridizing with a portion of nucleic acid, and comprises modified nucleotide at or near the 3'-terminal nucleotide.

Example 29; Page 158; 307pp; English.

The invention relates to a composition comprising one or more nucleic acid molecules and at least one oligonucleotide, where at least a portion of the oligonucleotide is capable of hybridising with at least a portion of the nucleic acid molecule and where the oligonucleotide comprises a modified nucleotide at or near the 3'-terminal nucleotide. The various analogue oligonucleotides are useful for quantification or detection of one or more target nucleic acid molecules in a sample during nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a composition comprising one or more nucleic acid molecules and at least one oligomucleotide, where at least a portion of the oligomucleotide is capable of hybridising with at least a portion of the nucleic acid molecule and where the oligomucleotide comprises a modified nucleotide at or near the 3'-terminal nucleotide. The various analogue oligomucleotides are useful for quantification or detection of one or more target nucleic acid molecules in a sample during nucleic acid synthesis or amplification. The analogues are also useful for determining the presence or absence of one or more particular nucleotides at a specific position or positions in a target nucleic acid molecule. The analogue oligomucleotides can also be useful for synthesising or amplifying one or more nucleic acid molecules, by mixing one or more nucleic acid molecules, by mixing one or more nucleic acid molecules or more nucleic acid cubating the mixture to synthesise or amplify one or more nucleic acid
synthesis or amplification. The analogues are also useful for determining the presence or absence of new or more particular nucleotides at a specific position or positions in a target nucleic acid molecule. The analogue oligonucleotides can also be useful for synthesising or manaplating one or more nucleic acid molecules, by maxing one or more nucleic acid molecules, by maxing one or more nucleic acid molecules, or an analogue oligonucleotides, and incubating the mixture to synthesise or amplify one or more nucleic acid molecules opposed and particular to all or a portion of the templates or targets. This polynucleotide sequence represents a nucleic acid detection and discrimination related oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      94.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition comprising nucleic acid molecules and a oligonucleotide capable of hybridizing with a portion of nucleic acid, and comprises modified nucleotide at or near the 3'-terminal nucleotide.

The invention relates to a composition comprising one or more nucleic acid molecules and at least one oligonucleotide, where at least a portion of the oligonucleotide is capable of hybridising with at least a portion of the nucleic acid molecule and where the oligonucleotide comprises a modified nucleotide at or near the 3'-terminal nucleotide. The various analogue oligonucleotides are useful for quantification or detection of comprises or more target nucleic acid molecules in a sample during nucleic acid comprises or expected acid molecules are also useful for determining the presence or absence of one or more particular nucleotides at a specific position or positions in a target nucleic acid molecule. The analogue oligonucleotides can also be useful for synthesising or analogue oligonucleotides can also be useful for synthesising or nucleic acid templates or targets with the analogue oligonucleotides, and incubating the mixture to synthesise or amplify one or more nucleic acid molecules complementary to all or a portion of the templates or targets. This polynucleotide sequence represents a nucleic acid detection and discrimination related oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                  ö
molecules complementary to all or a portion of the templates or targets. This polynucleotide sequence represents a nucleic acid detection and discrimination related oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid detection and discrimination related oligo SEQ ID No 103.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Composition comprising nucleic acid molecules and a oligonucleotide capable of hybridizing with a portion of nucleic acid, and comprises modified nucleotide at or near the 3'-terminal nucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises antisense oligonucleotides designed to inhibit expression of Syntaxin 4 interacting protein. The antisense oligonucleotides of the invention are useful for inhibiting the expression of Syntaxin 4 interacting protein in cells or tissues. The antisense oligonucleotides are also useful for treating an animal having a disease or condition associated with Syntaxin 4 interacting protein (e.g. diabetes, obesity or a skeletal muscle disorder). The antisense oligonucleotides can also be used to prevent or delay infection, franchamenton and tumour formation. The present DNA sequence represents a human Syntaxin 4 interacting protein antisense oligonucleotide. NoTE: The present percent sequence contains a phosphorothioate backbone and 2'-0-
                                                                                                                                                                                                                                                                                                                        Human, antisense gene therapy, Syntaxin 4 interacting protein; ss; antisense oligomucleotide; diabetes; obesity; skeletal muscle disorder; inflammation; tumour formation; phosphorothioate backbone; 2'-0-methoxyethyl wing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compound that hybridizes and inhibits nucleic acid molecule encoding Syntaxin 4 interacting protein, useful for treating diabetes, obesity and skeletal muscle disorder.

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprishing modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a fungus to an antifungal agent that inhibits the growth of a diploid fungus or and for identifying a compound which modulates the activity of a gene product, preferably enrymatic activity, carbon activity of a gene product, preferably enrymatic activity, carbon activity. The method is useful for identifying a compound which modulates the activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present esquence is that of a present in the method of the invention. Note: The sequence is that of a present in the method of the invention. Note: The sequence is that of a present in the method of the invention. Note: The sequence is that of the method is the present entering the present parameter of a per present in the method of the invention. Note: The sequence is that of the present is not represented in the present esquence is that of the present in the present of the present parameter of a per present of the present parameter of a per present of the present parameter 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         on sequence information supplied to Derwent by the Buropean Patent Office

This invention describes a novel murine calpain protease 12 (capn12). The calpain protease of the invention, related proteins and mucleic acid that encodes it, are useful for treatment (including gene therapy) of diseases associated with insufficient expression of the calpain protease. The specific immunoglobulins (Ig) useful for diagnosis. Also the polymucleotide encoding capn12 is useful, e.g. as primers and probes, for diagnosis of diseases, or predisposition to them, and for recombinant production of capn12. This sequence represents the murine calpain 12, capn12 exon 19 splice donor site described in the disclosure of the
                                                                                                     Calpain protease; murine; gene therapy; screening; diagnosis; capn12; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New calpain protein 12 with cysteine protease activity, useful for treating specific deficiency disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ouery Match 0.8%; Score 13.6; DB 1; Length 20; Best Local Similarity 80.0%; Pred. ```
This invention relates to an isolated polynucleotide encoding human NEDD-1, which is cytostatic in its action. The polynucleotide is useful for diagnosing diseases caused by mutation in human NEDD-1, and for diagnosing or monitoring diseases caused by altered expression of human NEDD-1. Fragments of NEDD-1 are useful as hybridisation probes and primers, and to direct expression or synthesis of epitopic or immunogenic protein fragments. The proteins are useful as therapeutic supplement in patients with specific deficiency in human NEDD-1 production, and for treating subjects preferably with defects in NEDD-1. The present sequence is a PCR primer related to human NEDD-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HKNO1; ss; chromosome 18p; bipolar affective disorder; BAD; PCR; primer; severe bipolar affective (mood) disorder; BP-1; schizophrenia; Hong Kong new gene 1; antimanic; antidepressant; neuroleptic.

The invention relates to an isolated nucleic acid molecule comprising a nucleotide sequence that encodes a Hong Kong New Gene (HKNG) 1 gene product. The human gene for HKNG1 is located on chromosome 18p in an area associated with bipolar affective disorder, BhD. Also included are an expression vector comprising the nucleic acid, a host call expressing the nucleic acid, an anti-HKNG1 antibody, a method of identifying modulators of HKNG1, and identifying an individual (at risk of) having HKNG1 mediated disorder comprising detecting the presence or absence of a disorder, where the presence of the polymorphism indicates that the disorder at risk of having HKNG1 allele associated with the individual (is at risk of) having HKNG1—mediated disorder. A (small individual (is at risk of) having HKNG1—mediated disorder. A (small
                                                                                                                                                                                                                       New nucleic acid molecule Hong Kong New Gene 1 (HKNG1), useful for
screening for molecules which modulate HKNG1 expression for the treatment
of bipolar disorder and schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           molecule) compound which modulates (inhibits or potentiates) expression of a HKNG1 gene or gene product in a human individual is useful for the treatment of a HKNG1-mediated disorder with as bipolar affective disorder (BAD), severe bipolar affective (modd) disorder (BP-I) and schizophrenia. The present sequence is PCR primer which amplifies a HKNG1 exonic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Caspase 7; antisense modulation; antiinflammatory; cytostatic; antisense therapy; caspase 7 inhibitor; inflammatory condition; hyperproliferative disorder; cancer; bone metabolism; infection; cholesterol disorder; inflammation; tumour; phosphorothioate; ss.

The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7.

(1) has antinifammatory and ofvostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (1) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (1) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (1) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represent a mouse caspase 7 inhibiting chimeric phosphorothicate or represent a mouse caspase 7 inhibiting chimeric phosphorothicate
                                                                                                                                                                                                                                                                                                              Novel antisense compounds targeted to nucleic acids encoding caspase 7, for modulating gene expression and treating diseases associated with expression of caspase 7 in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Caspase 7; antisense modulation; antiinflammatory; cytostatic; antisense therapy; caspase 7 inhibitor; inflammatory condition; hyperproliferative disorder; cancer; bone metabolism; infection; cholesterol disorder; inflammation; tumour; phosphorothioate; see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4; Indels '0;

The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7.

(1) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (1) is useful for inhibiting the expression of caspase 7 expression. (1) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (1) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (1) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence oligonucleotide having 2. MOE wings and a decxy gap, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, Von Willebrand factor-cleaving protease; vWF-cp; therapy; enzyme; transgenic animal; immunisation; thromboembolic disease; preeclampsia; thrombotic thrombocytic purpura; TTP; Henoch-Schonlein purpura; thrombosis; neonatal thrombocytopeenia; haemolytic-uraemic syndrome; transgenic; anticoagulant; RT-PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                         Novel antisense compounds targeted to nucleic acids encoding caspase 7, for modulating gene expression and treating diseases associated with expression of caspase 7 in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human Von Willebrand factor-cleaving protease cloning PCR primer, 6395.

The invention relates to an isolated or substantially pure Von Willebrand factor-cleaving protease (vWF-cp) polypeptide. vWF-cp is useful for purifying vWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified vWF. vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunising an animal with vWF-cp and isolating the anti-vWF wF polypeptide antibodies from the animal. vWF-cp is useful for producing a preparation of prophylaxis and therapy of thrombosis and thrombombombolic disease such as thrombocic thrombocytopaenia or thrombombombolic disease such as thrombocic thrombocytopaenia or haemolytic-uraemic syndrome. vWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp
                                                                                                                                                                                                                                                                                                                                          Novel isolated or substantially purified Von Willebrand factor-cleaving protease, useful for producing preparation for therapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, PCR primer, identification, tumour senescence, cytotoxic, ss,

The present invention describes a method for identifying a compound that induces senescence in a mammalian cell comprising culturing the cell in the presence and absence of the compound, assaying expression of at least con controllular gene (Glas) from 50 or agene (G2) from 64 genes, with corresponding accession numbers given in the specification, and identifying compounds that induce senescence when expression of (Glas) or expression of (G2) is lower, in the presence of the compound Also described: (1) a compound that induces senescence in a mammalian cell; (2) assessing efficacy of a treatment of a disease or condition relating to abnormal cell proliferation or neoplastic cell growth; or (4) identifying a compound that inhibits senescence—associated inducin of cellular gene expression or neoplastic cell growth; or (4) identifying a compound that inhibits is useful for treating to abnormal cell proliferation or senescence—associated induction of cellular gene expression or condition relating to abnormal cell proliferation or senescence—associated inducing the present of the invention has a growth—inhibitory effect without producing systemic side effects found with other growth-inhibitory compounds. ABQ74611 to ABQ74734 represent PCR primers which are used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; mouse; HYPLIP1; FCHL1; familial combined hyperlipidaemia; cancer;
                                                                                                                                                                                                                          Identifying a compound that induces senescence in a mammalian p53 deficient or tunor cell comprises assaying expression of cellular genes in the presence of the compound with expression of the genes in the absence of the compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match 0.8%; Score 13.6; DB 1; Length 20; Best Local Similarity 80.0%; Pred.                                                                                                                                                                           The invention relates to an isolated polynucleotide comprising a sequence variation of a mouse HYPLIP1 CDNA or a human FCHL1 (familial combined hyperlipidaemia) gene. The FCHL1 polynucleotide, the FCHL1 polypeptide or antibody immunoseactive to the FCHL1 polypeptide are useful for treating or preventing cancer associated with expression of FCHL1, as well as for treating lipid disorder. The mouse HYPLIP1 cDNA or human FCHL1 gene are also useful for diagnosing or prognosing a predisposition to lipid disorder and cancer. ABK70902-ABK71303 represent mouse HYPLIP1, human FCHL1 coding sequences and PCR primers of the invention
                                                                                                         ö

```
The invention relates to a novel isolated nucleic acid molecule comprising a sequence that encodes a thioesterase or thioesterase domain,
                                                                                                                                                      The present invention relates to novel antisense oligonucleotides which are targetted to nucleic acids encoding human raf proteins and capable cinhibiting raf expression. The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an antisense oligonucleotide targetted to human c-raf kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated nucleic acid molecule from a bacterial daptomycin biosynthetic gene cluster encoding a thioesterase or thioesterase domain, useful for generating novel linear and cyclic peptides, and products in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Daptomycin biosynthetic gene cluster; thioesterase; antibacterial; fungicide; virucide; antiparasitic; immunomodulator; antilipemic; cytostatic; gene therapy; antimitotic; immunomodulatory; siderophore; anti-cholesterolemic; agrochemical; linker; PCR; primer; ss.
                                                         Treating cancer, angiogenesis or neovascularization by administering antisense oligonucleotides targeted to human raf sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S. roseosporus daptomycin biosynthetic gene cluster PCR primer P92

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                         The present invention relates to oligonucleotides having at least one non-terminal pyrimidine nucleoside modified and additionally having the 5'-and/or 3'-terminal modified. These can be used in the treatment of viral infections, such as HIV, HSV-1, HSV-2, influenza virus, VSV, hepatitis B and papilloma viruses, cancer and diseases involving integrins and cell-adhesion receptors. The present sequence is an antisense oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; raf; hyperproliferation; neovascularisation; ocular angiogenesis;

derived from a bacterial daptomycin biosynthetic gene cluster. The proceins of the invention have antibacterial, fungicide, virucide, antiparasitic, immunomodulator, antilipemic, and cytostatic activity. The polynucleotides may have a use in gene therapy. The compositions and methods of the present invention are useful for generating novel linear and daptomycin non-ribosomal peptide synthetase (NRPS) to be used as new compounds or in producing new compounds, such as antibiotics, antifungals, antivirals, antiparasitics, antimitotics, antitumour agents, immunomodulatory agents, anti-cholesterolemic agents, siderophores, agrochemicals and cytostatics. The sequence represents a PCR primer used in the invention to amplify the S. roseosporus daptomycin biosynthetic gene cluster from a BAC library
                                                                                                                                                                                                                                                                          ö

The invention relates to a composition (I) comprising AGP-3 receptor (tumour necrosis factor ligand family member) related protein (II) attached to a vehicle protein. (I) is useful for modulating AGP-3-related activity in mesenteric lymph nodes (MLN) of a mammal. (II) is useful in assays to identify cells and tissues that express AGP-3R or proteins related to AGP-3R related protein and for identifying compounds (agonists or antagonists) that interact with AGP-3R proteins. (II) is also useful for identifying intracellular proteins that interact with the respective cytoplasmic domains by yeast two-hybrid screening process. (II) is anyolved in B cell growth, survival and activation particularly in lymph node, spleen, and Peyer's patches. AGP-3R agonists and antagonists involved using (II) are used for modulating B cell response and are used to treat diseases characterised by inflammatory processes or deregulated immune response such as rheumatoid arthritis, graft-versuschost disease. Crohn's disease, lupus, etc. (II) is also useful in the production of hybridoma cells which are derived from B cells, which involves treating the hybridoma cells with (II). (II) is useful in the transment of inflammatory conditions of joints or antagonists are useful for treating acute pancreatitis, and protophic lateral sclerosis (ALS), Alzheimer's disease, asthma, atherosclerosis, cachexia/anorexia, is schaemic injury including crebral ischaemia, multiple myeloma, multiple sclerosis, osteoporosis, Parkinson's disease, pain, reperfusion injury, dermatological, neuroprotective, nootropic; immunosmodulator; metabolic; antidiabetic; analgesic; nephrotropic; osteopathic; cytostatic; fever; antidiabetic; analgesic; nephrotropic; osteopathic; cytostatic; fever; antipartinsonian; antipartiatic; vasotropic; antibacterial; asthma; AGP-3 receptor; tumour necrosis factor ligand family; AGP-3 receptor; nesenteric lymph node; AGP-3R; inflammatory disease; immune disorder; rheumatorid arthritis; graft-versus-host disease; immune disorder; pancreatitis; amyotrophic lateral sclerosis; ALS; Alzheimer's disease; disease; glomerulonephritis; inflammatory bowel disease; ischaemia; ss; multiple sclerosis; Parkinson's disease; transgenic animal; PCR primer. Composition, useful for identifying modulator of receptor for treating asthma and glomerulonephritis, comprises AGP-3 (tumor necrosis factor ligand family member) receptor and encoding nucleic acids. cothe human or mouse CCAAT/enhancer-binding protein alpha (C/EBP alpha)

cothe human or mouse CCAAT/enhancer-binding protein alpha (C/EBP alpha)

designed to target different regions of the human and/or mouse C/EBP

alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels

by quantitative real-time PCR. The C/EBP family of proteins are a family

of transcription factors which regulate the expression of a wide range of

genes that control normal tissue development, cellular function, cellular

cofferation and functional differentiation. C/EBP beta (also known as

c/EBB2, LAP, TGES, CRE2, NRIE6, IL6DBP, NB-M, AGP/EBP and Apc/EBP)

primarily regulates hormone responsiveness and oxidative stress responses

and is a mediator of IL-6 (interleukin-6) signalling. C/EBP beta is

thought to be involved in carbohydrate metabolism, immunity, the Th1

response, female fertility and gluconeogenic pathways. C/EBP beta is

cropped to the liver lung, spleen, kidney, brain, and testis, with the

lighest expression in pancreas is upregulated in response to chronically

and its expression in pancreas is upregulated in response to chronically

clevel in malignant ovarian tissue compared with normal ovarian tissue,

and its expression in pancreas is upregulated in response to chronically

clevel the invention are useful for diagnosis, prevention and treatment of

conditions associated with C/EBP beta expression, such as cancer

(particularly ovarian cancer), tumour formation, diabetes (particularly

type II diabetes), infection, or inflammation

Screening substances inhibiting the binding of signal-transducing molecule to KDR/Flk-1 phosphorylated at tyrosine at 1175-position, as cell proliferation inhibitors and angiogenesis inhibitors for treatment

The invention relates to inhibiting the signal transduction of KDR/FIk-1 (Kinase insert domain-containing receptor/fecal liver kinase-1) is by using a substance inhibiting the binding of a signal-transducing molecule to KDR/FIk-1 phosphorylated at tyrosine at the 1175-position. Also included are methods of detecting/inhibiting/screening for cell conjuded are methods of detecting/inhibiting/screening for cell complete at tyrosine at the 1175-position. Also inhibitors, compounds obtained by the screening methods, drugs containing the inhibitors, compounds obtained by the screening methods, drugs containing to the inhibitors, a monoclonal antibody or its fragment, a recombinant vector containing the monoclonal antibody or its fragment, a recombinant vector containing the conclonal antibody or its fragment, a recombinant vector containing the phosphorylated at tyrosine at the 1175-position, a DNA encoding the containing the binding of a signal-transducing molecule to KDR/FIk-1 conhibiting the binding of a signal-transducing molecule to KDR/FIk-1 conhibitors and anglogenesis inhibitors for treatment of e.g. tumour, diabetic omentopathy and chronic rheumatoid arthritis. A method for cettering anglogenesis is also provided. The present sequence is a PCR to Phe

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.

Example 5; Fig 29; 300pp; English

%XGGGGGGGGGGGGGGGGGGGGGGGGG

The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents (e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergilus fundsautus, viruses e.g. T-cell lymphocytorrophis cirus, Epstein-Barx virus and policy of T. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, psi gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and federity and compresses scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe processes course of the target nucleotide sequences. Novel isolated human peptide histidine transporter which facilitates peptide transport across cell membranes in gastrointestinal tract, useful as target for evaluating peptide and peptide-based drug transport.

Example 2; Page 55; 95pp; English.

The present invention relates to nucleic acid sequences encoding human

peptide histidine transporter 1 (hPHT1) protein, the hPHT1 proteins and methods for using them. The nucleic acid sequences of the invention are is useful for screening a test compound for human PHT1 modulating cativity. The hPHT1 proteins are useful as a target for evaluating cativity. The hPHT1 proteins are useful as a target for evaluating peptide and peptide-based drug transport. The functional characterisation of the hPHT1 proteins are useful as a target for a particular substrate to the molar expression level of hPHT1 provides crucial information regarding the ability of this transporter to facilitate the uptake and transport across cell membranes in the PHT1 proteins facilitate peptide transport across cell membranes in the pHT1 protein facilitate and other organs in which they are expressed. The identification of full length hPHT1 close facilitates the development of optimal peptide-based drugs for treating patients with hPHT1-related diseases. AAS20818-AAS20811 represent reverse transcriptase (RT)-PCR primers used in the methods of the present invention

New isolated lipid metabolism regulator nucleic acid, useful for producing transgent plants having modified level of seed storage compound, e.g. lipids for generating seed oils which have the ability of reducing risk of heart disease.

Example 2; Page 34; 72pp; English.

The present sequence is that of a primer for an AINTEGUMENTA-like protein gene of Arabidopsis thallana. Overlapping PCR primers (see ARG1398-407) were used in amplification and sequencing reactions to identify sequence changes in 2 wril mutants compared to wild-type sequences in order to identify the true wril gene. In subsequent experiments, wril mutants were complemented with cosmids containing wild-type genomic DNA, and PCR was used to produce a full-length wril CDNA (see ARG81395) encoding a lipid RESULT 13
